

▶ Version 10.1

▶ Development Tools

▶ Thread Name

Thread Name

`⊠TNAME`

The system variable `⊠TNAME` reports and sets the name of the current APL thread. This name is used to identify the thread in the Tracer.

The default value of `⊠TNAME` is an empty character vector.

You may set `TNAME` to any valid character vector, but it is recommended that control characters (such as `⊠AV[⊠IO]`) be avoided.

Example:

```
⊠TNAME←'Dylan'  
⊠TNAME  
Dylan
```
