The Session Log

The Session log is configurable via the *Log* tab of the Dyalog Configuration dialog, as shown here:

- You can specify the size of the Session Log and other buffers associated with the Session
- You can specify a Session log file which is written out when you close your session. When you next start Dyalog, your session log will be restored from this file.

Use session log file:

Check this box if you want your session to be saved on file, and specify the name of the file to be used. Note that the default file extension is .DLF (Dyalog Log File).

Session log size (Kb)

This specifies the amount of memory allocated to your Dyalog APL Session log, whether or not you are using a log file. The default is 40Kb. This buffer is allocated when you start your Dyalog APL session from Windows memory and not from your active workspace. If your current log file is larger than this buffer, lines will be discarded from the beginning of the log. Once you have filled this memory buffer, lines will be dropped from the beginning of the log as new ones are added to the end.

Input buffer size (Kb)

This specifies the size of the input buffer. This buffer is used for the bottom line in the Session window in which you are typing, and all other *marked* lines (lines in the log that you have altered), prior to you pressing Enter to execute them. The input buffer is also used to accept text pasted into the Session window from the Windows clipboard. The default is 4Kb.

History buffer size (Kb)

This specifies the size of the buffer that holds lines that you have previously entered that may be recalled (using the Back/Fwd tool buttons) for re-submission. The default is 4Kb.

PFKey buffer size (Kb)

This specifies the size of the buffer in which your PFKey definitions are stored. The default is 4Kb.
