### Value Tips

If you hover the mouse pointer over a name in the Session or Debugger window, APL will display a pop-up window containing the value of the symbol under the mouse pointer

The picture shows several value tip displays in succession:

1. *MakeSalt* function using the Tip colour scheme
2. *MakeSalt* function using the Dyalog colour scheme
3. *Currencies* variable (a vector of character vectors)
4. *DSSPrices* variable (a numeric matrix)

The colours used to display the value tip are fully configurable; these are just examples.

## Value Tips

### Configuring Value Tips

You may enable/disable Value Tips and select other options from the General tab of the Configuration dialog box as shown below.

You may experiment by changing the value of the delay before which Value Tips are displayed, until you find a comfortable setting.

Note that the colour scheme used to display the Value Tip for a function need not necessarily be the same colour scheme as you use for the function editor.
