

Glasgow 2024

APL Functions to Import, Export and Process Data in Files

Richard Smith

Peter Mikkelsen

Setup

- ◆ Copy FILE*.txt from
<https://github.com/dyalog-training/2024-TP2>
- ◆ Dyalog 19.0
 - ◆ 18.2 ok for all but one exercise
- ◆ In APL session, do:
]CD "/Path/To/Files"

Agenda

- ◆ **Text files**
- ◆ CSV files
- ◆ Portable file functions
- ◆ JSON
- ◆ XML

Aren't text files really simple?

- ◆ Files just contain a stream of bytes, which are easily mapped to characters.
- ◆ ... so long as everyone only needs a few distinct characters and glyphs.
- ◆ ... and everyone agrees the line-ending style.
- ◆ ... and everyone uses the same mapping.

History of character encodings

- ◆ Pre-ASCII (inc ASCII 1963).
- ◆ ASCII: 7-bit:
 - ◆ Includes file control chars.
 - ◆ Includes DEL at 0x7F.
 - ◆ International variations:
 - ◆ £ or #
 - ◆ \ or ¥ ... etc
- ◆ Extended ASCII: 8-bit:
 - ◆ Region-specific chars.
 - ◆ Different mappings 128→.
- ◆ EBCDIC: 8 bit:
 - ◆ Entirely different ordering.
 - ◆ International variations.

History of character encodings

- ◆ UNICODE (16+ -bit):
 - ◆ No national variations.
 - ◆ UTF-16.
 - ◆ UTF-16 with Surrogates.
 - ◆ UTF-32.
 - ◆ Byte ordering and BOMs.
 - ◆ UTF-8.
- ◆ Line-Endings:
 - ◆ CR LF.
 - ◆ CR.
 - ◆ LF.
 - ◆ NEL (UNICODE).
 - ◆ ...
 - ◆ Last line?

Text files are not at all simple!

- ◆ Dyalog tries to make reading and writing them as simple as possible.
- ◆ Three “mystery” text files: FILE1.txt, FILE2.txt, FILE3.txt.

Demo and exercise 1

```

A Exercise 1: see how well your OS handles them.
```

□NGET and □NPUT

- ◆ Read and write text files
 - ◆ Powerful, but simple in almost all cases.

⎕NGET and ⎕NPUT

⎕NGET *filename*

- ◆ Deduces the encoding used.
- ◆ Returns a 3-element array:
 - ◆ The text, with normalised line-endings.
 - ◆ The deduced encoding.
 - ◆ The line-ending type.

□NGET and □NPUT

- ◆ Optional: encoding in left argument.
 - ◆ `'UTF-8' □NGET 'FILE1.txt'`
- ◆ Optional: return text as vector of character vectors.
 - ◆ `□NGET 'FILE1.txt' 1`

Demo and Exercise 2

```

Agenda

- ◆ Text files
- ◆ **CSV files**
- ◆ Portable file functions
- ◆ JSON
- ◆ XML

CSV: Comma Separated Values

- Text file containing records split into fields, using a comma as a field separator

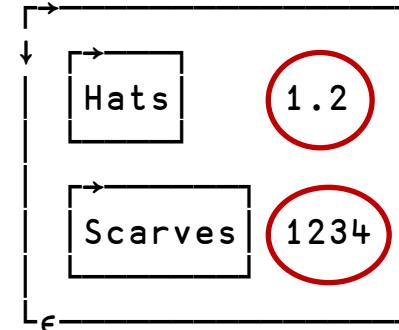

Hats,1.2

Scarves,1234

- Other delimiters are used – e.g. in Europe a semicolon is more usual

Hats;1,2

Scarves;1234

CSV has *lots* of config options

Field separator characters, escape mechanism, decimal separator characters, thousands separator characters, redundant whitespace trimming, even or uneven length records, fixed or variable-width fields, quotation mark characters, output matrix format, specification of column datatypes, handling of missing fields, input source specification, separation of header record.

Exercise 4

Import
FILE5.txt
(products) &
FILE6.txt
(orders)
(see FILE7.txt)

Then:

Deduce some interesting things, such as:

- ◆ Number of capsules in each order.
- ◆ Total spend.
- ◆ Most popular variety.

Exercise 4 walk-through

```

Intermission

```
j<-'{"a":1}'  
)ed j  
A Pressing "reformat" in the editor (/ on the numeric keypad)  
A reformats JSON text into non-compact form  
A i.e. changes the text to:  
A {  
A   "a": 1  
A }  
A Undo (Ctrl-Shift-Backspace) reverts  
A Redo (Ctrl-Shift-Enter) redoes
```

JSON

- ◆ Text containing structured data:
 - ◆ Numbers
 - ◆ Strings (character arrays)
 - ◆ Objects (namespaces)
 - ◆ Vectors
 - ◆ Booleans, null
 - ◆ Infinity, NaN

JSON types without APL equivalents

Another form for JSON tables

- Specifically, tables with:

- Some columns
- One header row
- Some rows of data

The diagram illustrates the structure of a JSON table. On the left, three orange hexagonal icons point to specific features in the table on the right. The first icon points to the 'Some columns' row, the second to the 'One header row' header, and the third to the 'Some rows of data' body.

Code	Description	Cost	Vol
7197	Stormio	0.62	230
7201	Melozio	0.62	230
7209	Barista Creations Choc Fudge	0.65	230
7211	Master Origins Columbia	0.69	230
7216	Altissio	0.48	40
7218	Dipinto	0.47	10

Another form for JSON tables

A table can be represented as:

- ◆ An array of objects
- ◆ Where each object contains named items
- ◆ And each item's name is a column name
(header value)
- ◆ And each value is the cell content

For example...

Code	Description	Cost	Vol
7197	Stormio	0.62	230
7201	Melozio	0.62	230
7209	Barista Creations Choc Fudge	0.65	230
7211	Master Origins Columbia	0.69	230
7216	Altissio	0.48	40
7218	Decaf	0.40	10

Five-column matrix:

- Level
- Element name
- Character data (if any)
- Attributes
- Row type

Row type:

3 – element with sub-elements

5 – element with character data

Exercise 7

Import
FILE8.txt
(products) &
FILE9.txt
(orders)

Then:

Experiment with processing the data, e.g.:

- ◆ List the individual products.
- ◆ List the orders, with product names.

□ XML ➔ NGET 'FILE8.txt'

Exercise 7 walk-through
